ABSTRACT OF THE DISCLOSURE

4 A construction material such as an insulating roofing
5 material is prepared by slitting a sheet of flexible material,
6 such as cardboard, plastic, or metal foil, to provide discontinu-
7 uous slits in spaced apart parallel lines, and then stretching
8 the slitted sheet to produce a three-dimensional cellular con-
9 figuration. The cells thereof are then filled with melted tar
10 and aggregate, such as sand, and then cooled to provide a
11 layer of construction material.
